

Triage sheet — print one page for Stephanie

Rules of engagement, before the table:

- **Anything not on this sheet: flag Mike. Don't improvise.** A wrong fix in front of a coach costs more than a two-minute wait.
- **Keep the running question log** — every question a coach asks, verbatim, even the ones you answer on the spot. That log is the webinar curriculum.
- Fixes are ordered by when coaches hit them: install → setup → first use → morning brief.

#	Symptom	Fix
1	Windows: Code tab won't start a session	Git for Windows isn't installed (pre-work step 3). Install it, then fully quit and reopen the app.
2	No Code tab at all	Free account — can't be fixed in the room. Pair them with a neighbor (Mike has the list of unconfirmed plans from the pre-work replies).
3	"Add marketplace" can't find the plugin	They typed a URL, or downloaded a ZIP from the web. The box wants exactly: radialreview/bloom-coach-kit — nothing else. Settings → Plugins → Add → Add marketplace.
4	Plugin installed but /meet-your-assistant isn't offered	Open a new session first. Still missing: Settings → Plugins → remove the marketplace, re-add it, reinstall, new session.
5	Skill finished but the assistant isn't there in a new session	Wrong folder — the assistant lives in the folder they picked during setup. Check the folder chip on the session screen. If the folder is right: quit the app completely, reopen, new session.
6	"It answers like a stranger / forgot who I am"	Same as #5 — folder first. If the folder is right, have them say: <i>"read your notes about me."</i>
7	"It never greeted me"	It won't speak first — that's by design. Have them type "good morning." The greeting comes back knowing who they are.
8	Files seem to be in the wrong place / "where did my stuff go"	They picked a folder that's set up for software projects (a git repo) — sessions get isolated copies. Move to a plain folder (Documents works) and re-run the setup skill.
9	Folder access denied	The trust dialog wasn't accepted. Reopen the folder and accept it.
10	Connector shows in the + menu but returns nothing	Re-authenticate it from the + menu, then start a new conversation .
11	Assistant/specialist says it can't see calendar or email	The connector was never authorized. + menu → connect it → approve in the browser → new conversation.
12	Morning brief came back without calendar (notes only)	The supervised Run now never happened or a permission prompt wasn't approved. Routines page → Run now → approve every

#	Symptom	Fix
		prompt that appears.
13	Morning brief page (the bookmark) shows yesterday	The app wasn't open at brief time — it catches up when the app next opens. Not a bug. Check the date at the top after the app has been open a minute.
14	Morning brief page never updates, even with the app open	Flag Mike — likely the page URL wasn't stored and runs are minting new pages. (Mike: check <code>agent-memory/<slug>/morning-brief-url.txt</code> exists and matches the bookmark.)
15	Coach on a Pro plan says Claude warned about usage limits	Model picker (name near the message box) → Sonnet . Assistant is unchanged. If it's the daily brief eating the plan: Routines → Edit routine → Model → Sonnet 5.

Weird ones that only happen on developer machines (unlikely Tuesday, listed so they don't burn time): scheduled runs missing connectors because the folder's settings contain an `agent` key from an old kit version (re-run the setup skill — it removes it), a stale second `claude` binary on PATH, or CLI auth on API billing instead of the claude.ai login. All three: flag Mike, move on.
